

<b>Lesson Title:</b>	<b>Photoelectric Effect Lab</b>
<b>AP Objective(s):</b>	<p>Students should understand the photoelectric effect, so they can:</p> <p>(3) Determine the maximum kinetic energy of photoelectrons ejected by photons of one energy or wavelength, when given the maximum kinetic energy of photoelectrons for a different photon energy or wavelength.</p> <p>(4) Sketch or identify a graph of stopping potential versus frequency for a photoelectric-effect experiment, determine from such a graph the threshold frequency and work function, and calculate an approximate value of <math>h/e</math>.</p>
<b>Assessment:</b>	Video Reflection Q's

AGENDA	KEY POINTS
1. PhET 2. Assessment	<p><u>Photoelectric Effect experiment</u></p> $E_{\text{photon}} = K_{\text{max}} + W_o$ $E_{\text{photon}} = hf \text{ (Planck's equation)}$ $K_{\text{max}}: \text{maximum kinetic energy of electrons (equal to stopping potential times charge of electron)}$ $W_o: \text{binding energy or "work function"}$ $hf = K_{\text{max}} + W_o$ $K_{\text{max}} = hf - W_o \text{ (this is the equation usually graphed)}$

Time	Learning Activity
45	<p><i>Teacher note – usually I do this lab after we have briefly discussed the photoelectric effect in class. Students know it simply as – when light shines on a metal surface electrons can be liberated. They will have read a short reading (see: <a href="http://physics.bu.edu/py106/notes/PhotoelectricEffect.html">http://physics.bu.edu/py106/notes/PhotoelectricEffect.html</a>) which discusses the equation for the energy of a photon <math>E=hf</math> and <math>K_{\text{max}}=hf-W</math> (which they will derive at the end of the lab).</i></p> <p>Students will read and annotate a short reading on the photoelectric effect (see link above). They will develop two questions they hope to have answered through their lab today.</p> <p>Students will receive their lab and laptops. They will spend the remainder of the class working on their lab.</p> <p><b>Possible Guiding Questions</b></p> <ol style="list-style-type: none"> <li>1. What happens in the simulation as you change the light from red to blue?</li> <li>2. Suppose that red light does not eject electrons for the metal you are studying, would changing the intensity of the light allow electrons to be ejected? Explain.</li> <li>3. What property of the light changes as its wavelength changes?</li> <li>4. Why do different metals have different work functions?</li> <li>5. If a metal has a high work function, what properties does it have?</li> </ol>

Questions for students to answer -

- 1) How is this experiment different than the PhET Experiment on the computer?
- 2) Why does changing the color of the filters affect if electrons are ejected?
- 3) What would happen if the intensity of the light source changed?
